

A new BMJ Quality and Safety editorial by Dr Roman Kislov, Senior Research Fellow at the Alliance Manchester Business School, has highlighted CLAHRC work as an example of successful engagement with management theory by researchers.

Dr Kislov's research focus is the processes and practices of knowledge mobilisation, and his editorial highlights our recent paper on how different NHS Boards implement a quality improvement intervention - the QUASER guide.

He cites the paper as *"an example of successfully deployed theoretically informative approach, highlighting some practical tips for researchers who aspire to move from merely applying theory towards entering into dialogue with it and, through doing so, refining its assumptions."*

Explaining organisational responses to a board-level quality improvement intervention: findings from an evaluation in six providers in the English National Health Service

Background Healthcare systems worldwide are concerned with strengthening board-level governance of quality. We applied Lozeau, Langley and Denis' typology (transformation, customisation, loose coupling and corruption) to describe and explain the organisational response to an improvement intervention in six hospital boards in England.

Brokering Innovation Through Evidence

What do hospitals need for a board-level quality improvement intervention to work?

Health-care systems world-wide are concerned with strengthening the governance of quality and safety in hospitals. In England, the national regulators are developing approaches and resources to support hospital leaders in their role in the governance of quality.

This study formed part of a mixed-methods evaluation of an initiative designed to help hospital boards develop an organisation-wide quality improvement strategy. The initiative used a research-based guide for senior hospital leaders to develop and implement organisation-wide QI strategies (the QUASER Guide) developed from a study of quality in hospitals in five European countries.

We asked: (1) ***How do public sector hospitals respond to a quality improvement intervention, and what are the effects?*** (2) ***How do features of the social and political context shape the response?*** and (3) ***What are the implications for the future design and implementation of quality improvement initiatives?***

What was the aim of the project?

This study aimed to understand and explain the effects of an initiative to support the senior leadership teams of hospitals improve the quality of care, and to identify lessons for the design of future initiatives.

The intervention

The intervention facilitated the use of a research-based guide for senior hospital leaders to develop and implement organisation-wide QI strategies (***the QUASER guide***). The guide is based on findings from the QUASER study of quality in hospitals, a collaboration between five European countries.

The use of the guide was facilitated in six provider organisations by Foresight Partnership (an organisational development consultancy). The intervention involved a self-assessment questionnaire, which was completed by both executive and non-executive members of the board. Each organisation nominated three board members to attend a series of learning events. In addition to developing an organisation-wide QI strategy, participants were given the task of implementing one organisation-wide QI project.

This research is funded by the National Institute for Health Research (NIHR) Collaboration for Leadership in Applied Health Research and Care North Thames (CLAHRC North Thames).
